Homework 5 released this morning, due next Tuesday the 9th at 11:59PM Boston time

Midterm 2 next Wednesday night through Friday night

Question on grades

Last time: Weak MaxFlow-MinCut Duality

- For any s-t flow f and any s-t cut (A, B) $val(f) \leq cap(A, B)$

$$\begin{aligned} val(f) &= \sum_{e \text{ from } A \rightarrow B} f(e) - \sum_{e \text{ from } B \rightarrow A} f(e) \\ &\leq \sum_{e \text{ from } A \rightarrow B} f(e) && \text{(by non-negativity)} \\ &\leq \sum_{e \text{ from } A \rightarrow B} c(e) = cap(A, B) && \text{(definition of capacity)} \end{aligned}$$

- If f is a flow, (A, B) is a cut, and $val(f) = cap(A, B)$, then f is a max flow and (A, B) is a min cut

Augmenting Paths

- Given a network $G = (V, E, s, t, \{c(e)\})$ and a flow f , an **augmenting path** P is an $s \rightarrow t$ path such that $f(e) < c(e)$ for every edge $e \in P$

Augmenting Paths

- Given a network $G = (V, E, s, t, \{c(e)\})$ and a flow f , an **augmenting path** P is an $s \rightarrow t$ path such that $f(e) < c(e)$ for every edge $e \in P$

Adding uniform flow on an augmenting path results in a new valid s-t flow!

Greedy Max Flow

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P
- Repeat until you get stuck

Does Greedy Work?

- Greedy gets stuck before finding a max flow
- How can we get from our solution to the max flow?

Residual Graphs

- Original edge: $e = (u, v) \in E$.
 - Flow $f(e)$, capacity $c(e)$

- Residual edge
 - Allows “undoing” flow
 - $e = (u, v)$ and $e^R = (v, u)$.
 - Residual capacity

- Residual graph $G_f = (V, E_f)$
 - Edges with positive residual capacity.
 - $E_f = \{e : f(e) < c(e)\} \cup \{e^R : c(e) > 0\}$.

Augmenting Paths in Residual Graphs

- Let G_f be a **residual graph**
- Let P be an augmenting path in the **residual graph**
- **Fact:** $f' = \text{Augment}(G_f, P)$ is a valid flow

```
Augment( $G_f, P$ )  
   $b \leftarrow$  the minimum capacity of an edge in  $P$   
  for  $e \in P$   
    if  $e \in E$ :     $f(e) \leftarrow f(e) + b$   
    else:          $f(e) \leftarrow f(e) - b$   
  return  $f$ 
```

Augmenting Paths in Residual Graphs

- Let G_f be a **residual graph**
- Let P be an augmenting path in the **residual graph**
- **Fact:** $f' = \text{Augment}(G_f, P)$ is a valid flow

```
Augment( $G_f, P$ )
   $b \leftarrow$  the minimum capacity of an edge in  $P$ 
  for  $e \in P$ 
    if  $e \in E$ :    $f(e) \leftarrow f(e) + b$ 
    else:         $f(e) \leftarrow f(e) - b$ 
  return  $f$ 
```

Note: This is the same process as the recurrence in Erickson 10.3!

$$f'(u \rightarrow v) = \begin{cases} f(u \rightarrow v) + F & \text{if } u \rightarrow v \in P \\ f(u \rightarrow v) - F & \text{if } v \rightarrow u \in P \\ f(u \rightarrow v) & \text{otherwise} \end{cases}$$

Ford-Fulkerson Algorithm

```
FordFulkerson( $G, s, t, \{c(e)\}$ )  
  for  $e \in E$ :  $f(e) \leftarrow 0$   
   $G_f$  is the residual graph  
  
  while (there is an  $s$ - $t$  path  $P$  in  $G_f$ )  
     $f \leftarrow \text{Augment}(G_f, P)$   
    update  $G_f$   
  
  return  $f$ 
```

```
Augment( $G_f, P$ )  
   $b \leftarrow$  the minimum capacity of an edge in  $P$   
  for  $e \in P$   
    if  $e \in E$ :  $f(e) \leftarrow f(e) + b$   
    else:  $f(e) \leftarrow f(e) - b$   
  return  $f$ 
```

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Ford-Fulkerson Algorithm

- Start with $f(e) = 0$ for all edges $e \in E$
- Find an **augmenting path** P in the **residual graph**
- Repeat until you get stuck

Running Time of Ford-Fulkerson

- For **integer capacities**, $\leq val(f^*)$ augmentation steps
- Can perform each augmentation step in $O(m)$ time
 - find augmenting path in $O(m)$
 - augment the flow along path in $O(n)$
 - update the residual graph along the path in $O(n)$
- For integer capacities, FF runs in $O(m \cdot val(f^*))$ time
 - $O(mn)$ time if all capacities are $c_e = 1$
 - $O(mnC_{\max})$ time for any integer capacities $\leq C_{\max}$
- We can speed FF up by choosing smarter augmenting paths
 - Fattest path: Choose the augmenting path with max capacity
 - Use modified BFS/MST or similar to find max capacity path
 - $\leq m \ln v^*$ augmenting paths
 - $O(m^2 \ln n \ln v^*)$ total running time
 - Shortest augmenting paths (“shortest augmenting path”)
 - $O(m^2n)$ time

Correctness of Ford-Fulkerson

- **Theorem:** f is a maximum s-t flow if and only if there is no augmenting s-t path in G_f
- **Strong MaxFlow-MinCut Duality:** The value of the max s-t flow equals the capacity of the min s-t cut
- We'll prove that the following are equivalent for all f
 1. There exists a cut (A, B) such that $val(f) = cap(A, B)$
 2. Flow f is a maximum flow
 3. There is no augmenting path in G_f

Optimality of Ford-Fulkerson

- **Theorem:** the following are equivalent for all f
 1. There exists a cut (A, B) such that $val(f) = cap(A, B)$
 2. Flow f is a maximum flow
 3. There is no augmenting path in G_f

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
- Sanity check: Is there such a cut in our example?

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
 - Let A be the set of nodes reachable from s in G_f
 - Let B be all other nodes
 - **Key observation:** no edges in G_f go from A to B

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
 - Let A be the set of nodes reachable from s in G_f
 - Let B be all other nodes
 - **Key observation:** no edges in G_f go from A to B
- If e is $A \rightarrow B$, then $f(e) = c(e)$
- If e is $B \rightarrow A$, then $f(e) = 0$

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
 - Let A be the set of nodes reachable from s in G_f
 - Let B be all other nodes
 - **Key observation:** no edges in G_f go from A to B

- If e is $A \rightarrow B$, then $f(e) = c(e)$
- If e is $B \rightarrow A$, then $f(e) = 0$

$$val(f) = \sum_{e:A \rightarrow B} f(e) - \sum_{e:B \rightarrow A} f(e)$$

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
 - Let A be the set of nodes reachable from s in G_f
 - Let B be all other nodes
 - **Key observation:** no edges in G_f go from A to B

- If e is $A \rightarrow B$, then $f(e) = c(e)$
- If e is $B \rightarrow A$, then $f(e) = 0$

$$\begin{aligned} val(f) &= \sum_{e:A \rightarrow B} f(e) - \sum_{e:B \rightarrow A} f(e) \\ &= \sum_{e:A \rightarrow B} f(e) \end{aligned}$$

Optimality of Ford-Fulkerson

- **(3 → 1)** If there is no augmenting path in G_f , then there is a cut (A, B) such that $val(f) = cap(A, B)$
 - Let A be the set of nodes reachable from s in G_f
 - Let B be all other nodes
 - **Key observation:** no edges in G_f go from A to B

- If e is $A \rightarrow B$, then $f(e) = c(e)$
- If e is $B \rightarrow A$, then $f(e) = 0$

$$val(f) = \sum_{e:A \rightarrow B} f(e) - \sum_{e:B \rightarrow A} f(e)$$

$$= \sum_{e:A \rightarrow B} f(e)$$

$$= \sum_{e:A \rightarrow B} c(e) = cap(A, B)$$

No augmenting path in G_f implies that we have a maximum cut!

Summary

- **The Ford-Fulkerson Algorithm solves maximum s-t flow**
 - Running time $O(m \cdot val(f^*))$ in networks with integer capacities
- **Strong MaxFlow-MinCut Duality: max flow = min cut**
 - The value of the maximum s-t flow equals the capacity of the minimum s-t cut
 - If f^* is a maximum s-t flow, then the set of nodes reachable from s in G_{f^*} gives a minimum cut
 - Given a max-flow, can find a min-cut in time $O(n + m)$
- **Every graph with integer capacities has an integer maximum flow**
 - Ford-Fulkerson will return an integer maximum flow

Applications of Network Flow

Applications of Network Flow

- Algorithms for maximum flow can be used to solve:
 - Bipartite Matching
 - Disjoint Paths
 - Survey Design
 - Matrix Rounding
 - Auction Design
 - Fair Division
 - Project Selection
 - Baseball Elimination
 - Airline Scheduling
 - ...

Applications of Network Flow

- Algorithms for maximum flow can be used to solve:
 - Bipartite Matching
 - Disjoint Paths
 - Survey Design
 - Matrix Rounding
 - Auction Design
 - Fair Division
 - Project Selection
 - Baseball Elimination
 - Airline Scheduling
 - ...

In general: If a problem can be solved in polynomial time, maximum flow can be used to solve it!

Reduction

- **Definition:** a **reduction** is an efficient algorithm that solves **problem A** using calls to function that solves **problem B**.

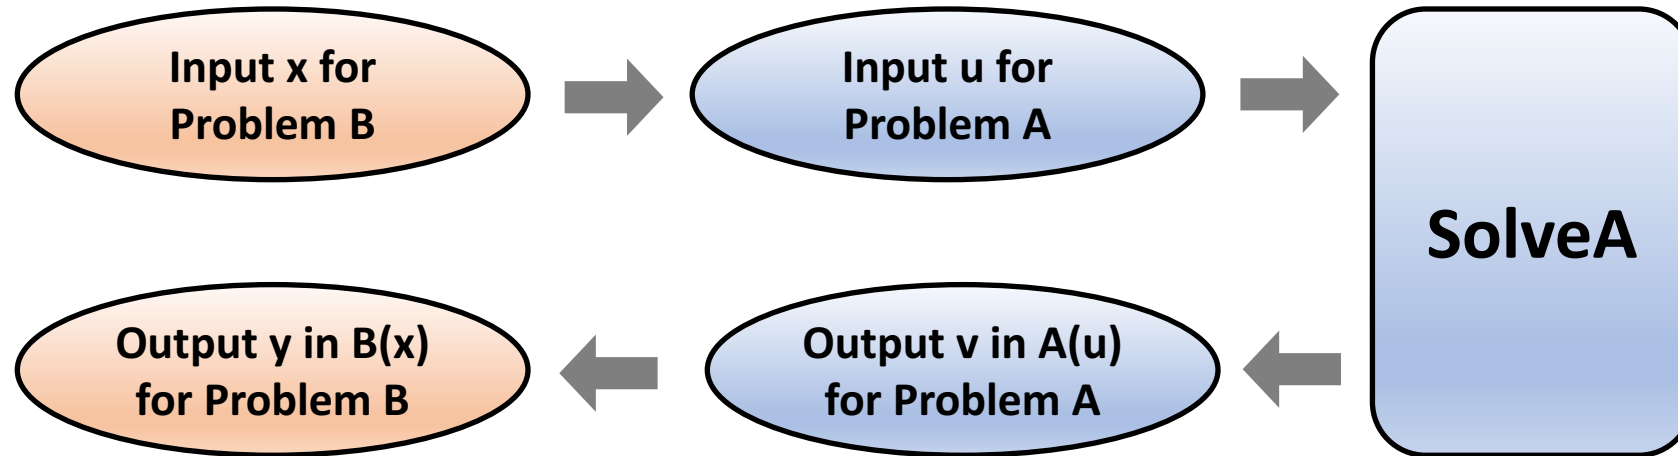

Mechanics of Reductions

- What exactly is a **problem**?
 - A set of legal inputs X
 - Ex: An array of numbers $A[1..n]$
 - A set $A(x)$ of legal outputs for each $x \in X$
 - Ex: The array A in sorted order
- **Example:** integer maximum flow
 - Input: $G = (V, E, s, t, \{c_e\})$ where c_e is an integer for every $e \in E$
 - Output: A maximum flow $\{f(e)\}$ for G where $f(e)$ is an integer for every $e \in E$ such that $0 \leq f(e) \leq c_e$

Mechanics of Reductions

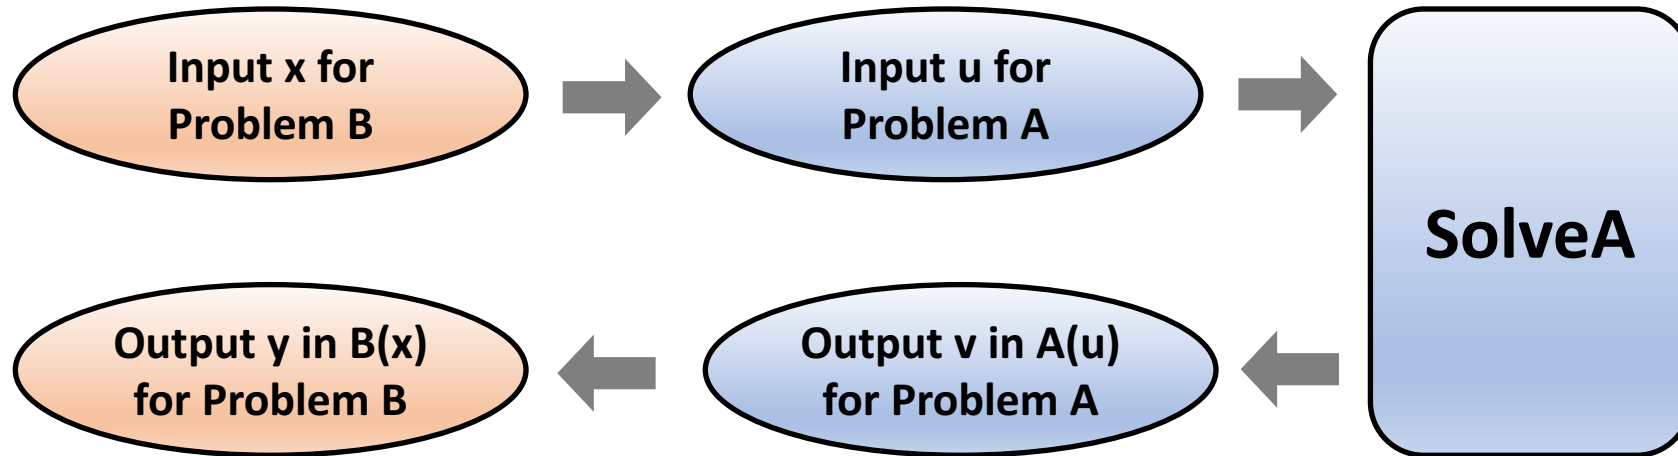

- What exactly is a **problem**?
 - A set of legal inputs X
 - Ex: An array of numbers $A[1..n]$
 - A set $A(x)$ of legal outputs for each $x \in X$
 - Ex: The array A in sorted order

Mechanics of Reductions

In the simplest case, we just call SolveA a single time. In fact we may use SolveA as a subroutine to a more complex reduction.

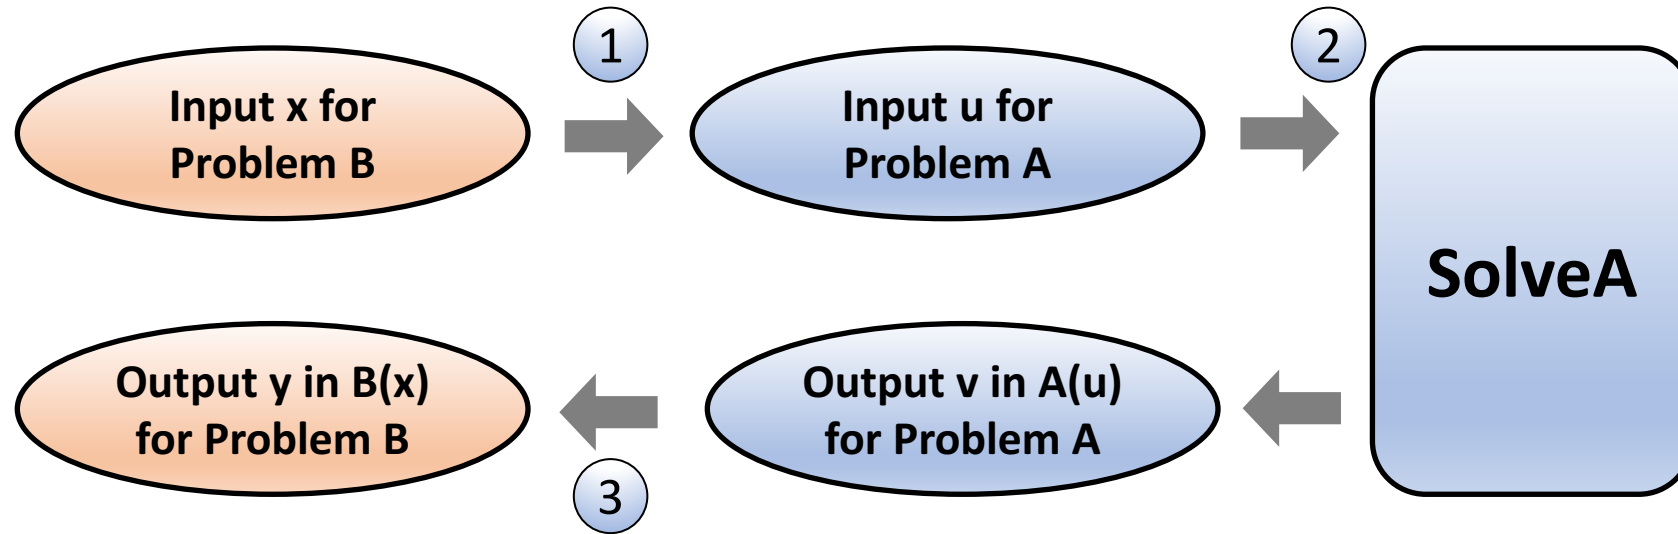

When is a Reduction Correct?

Assume that for valid input u , SolveA returns a valid output v in $A(u)$.

Then for every valid input x , if v is a valid output in $A(u)$, then y is a valid output in $B(x)$.

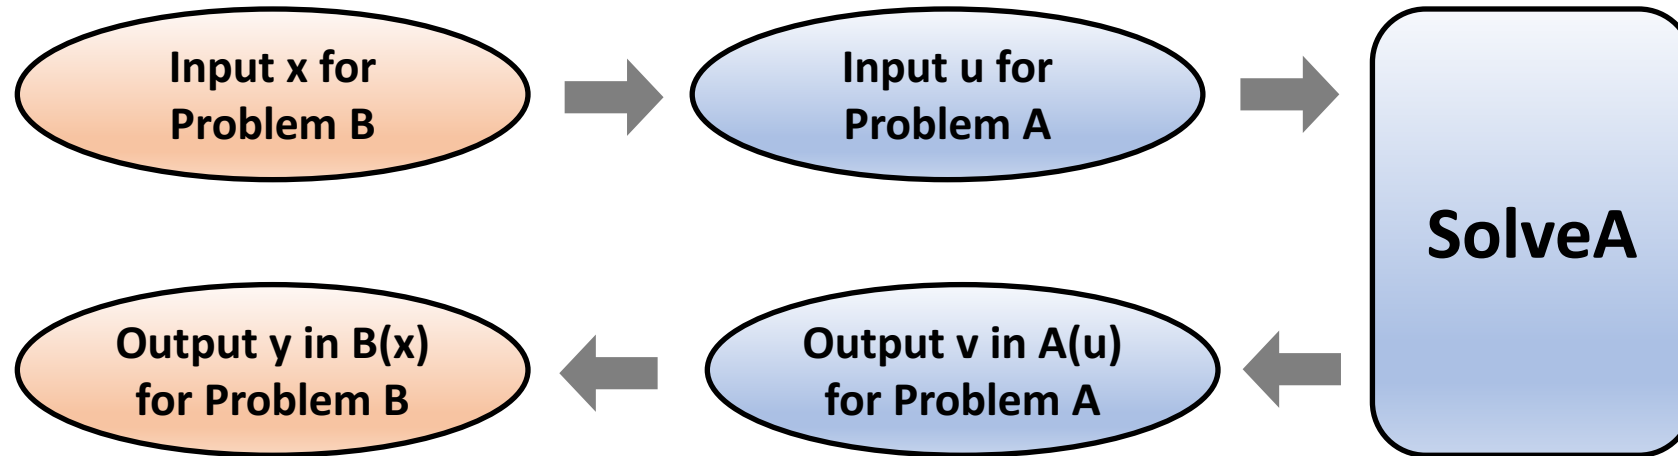

What is the Running Time?

Running time: ① + ② + ③

Example: Minimum Cut

A = MaxFlow
B = MinCut

Input x for B: $G = (V, E, s, t, \{c_e\})$

Input u for A: $G = (V, E, s, t, \{c_e\})$

Output $v \in A(u)$: $G = (V, E, s, t, \{c_e\})$

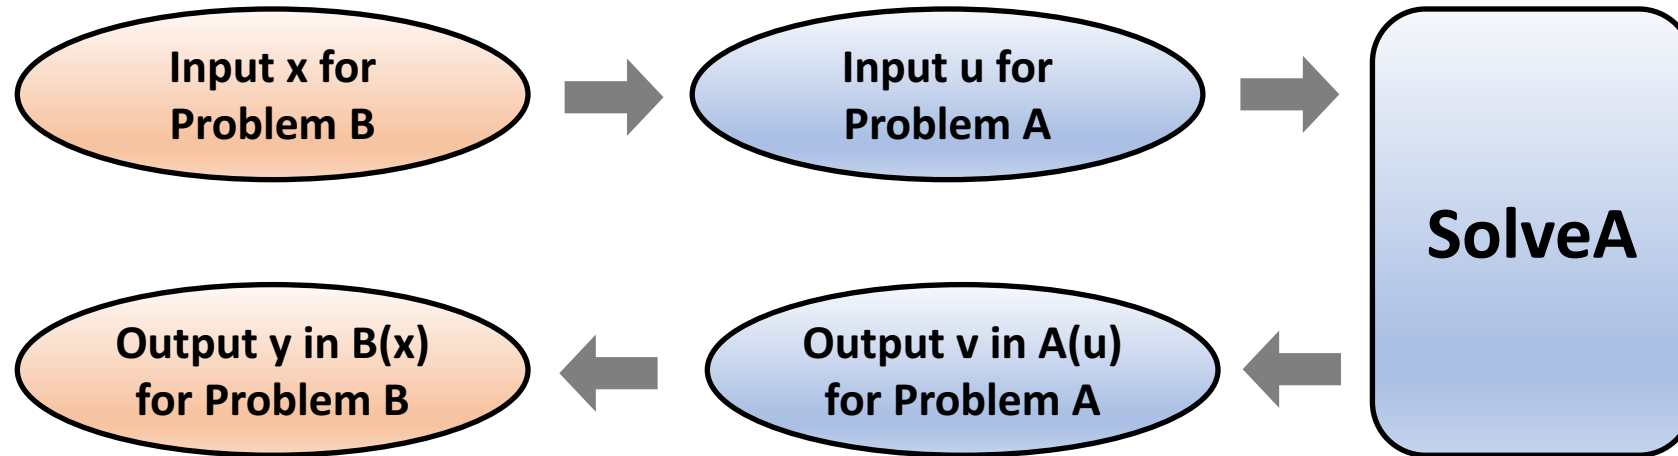

Output $y \in B(x)$: $G = (V, E, s, t, \{c_e\})$

1. Take f , compute the residual graph G_f
2. Find the nodes reachable from s in G_f
3. Output these nodes

Example: Median

A = MergeSort
B = Median

Input x for B: Array of length n , $A[1..n]$

Input u for A: Same array

Output $v \in A(u)$: Sorted version of $A[1..n]$

Output $y \in B(x)$: $A[\lfloor \frac{n}{2} \rfloor]$

Wrap-up

Next time we will see examples of using reductions to solve problems

Suggested Reading:

- Reductions on Wikipedia: [https://en.wikipedia.org/wiki/Reduction_\(complexity\)](https://en.wikipedia.org/wiki/Reduction_(complexity))
- (very optional for now) Erickson Chapter 12
 - He talks about reductions starting in 12.5
 - The first 4 sections will be more relevant for the last week of classes

Work on homework 5!
